

## FLINTROCK FARMS GENERATES HEAT & CONCENTRATED NUTRIENTS FROM FARM WASTES

“The fully automated Ecoremedy® system is easy to start-up and runs continually with little oversight. Anyone with a mechanical background can operate the system with confidence and ease.”

– Justin Morey, Farm Manager, Flintrock Farms

### CHALLENGES

In 2013, Flintrock Farms (central Pennsylvania) sought ways to better manage waste from 600,000 chickens per year and reduce energy costs.

### OUR SOLUTION

An Ecoremedy® system that converts the potential energy in animal wastes to hot thermal fluid (200 F) for heating over 100,000 square feet of chicken houses with less than 2 F temperature variance inside the houses.

### SUMMARY

Ecoremedy®'s first commercial poultry project successfully generates renewable energy, improves soil fertility, and addresses pressing environmental problems in the Chesapeake Bay watershed. It is the first commercial manure-only gasification project in Pennsylvania to operate as intended since commissioning.

The manure is converted to a dry, odorless fertilizer that is pathogen-free, more bioavailable to crops than manure, and will not leach into the local waterways thereby avoiding nutrient runoff. It is easy to haul, store, and spread.

### ECOREMEDY® IMPACT

This Ecoremedy project has the annual capacity to convert 1,585 wet tons of poultry litter to:

- 1.8 Million Btus per hour of renewable thermal energy, replacing 154,000 gallons of propane
- 240 tons of concentrated, all-natural fertilizer, avoiding:
  - 56 tons of nitrogen runoff
  - 60 tons of phosphorous runoff
